Chronic Effects: Clinical use of gentamicin sulfate has had adverse effects on the kidneys.

Sensitization: Gentamicin sulfate is a skin sensitizer in some individuals.

Germ Cell Mutagenicity: None of the components have been shown to cause germ cell mutagenicity. Aminoglycoside antibiotics have been found to be non-mutagenic.

Reproductive Toxicity: Gentamicin has been shown to depress body weights, kidney weights, and median glomerular counts in newborn rats when administered systemically to pregnant rats. Aminoglycosides can cause fetal harm when administered to a pregnant woman. Aminoglycoside antibiotics cross the placenta, and there have been several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy. Serious side effects to mother, fetus or newborn have not been reported in the treatment of pregnant women with other aminoglycosides. Animal reproduction studies conducted on rats and rabbits did not reveal evidence of impaired fertility or harm to the fetus due to gentamicin sulfate.

Carcinogenicity: No carcinogenicity studies have been performed with gentamicin sulfate. None of the components present at 0.1% or greater are listed as carcinogens by IARC, NTP or OSHA.
